EASTERN SHORE ENTERPRISES

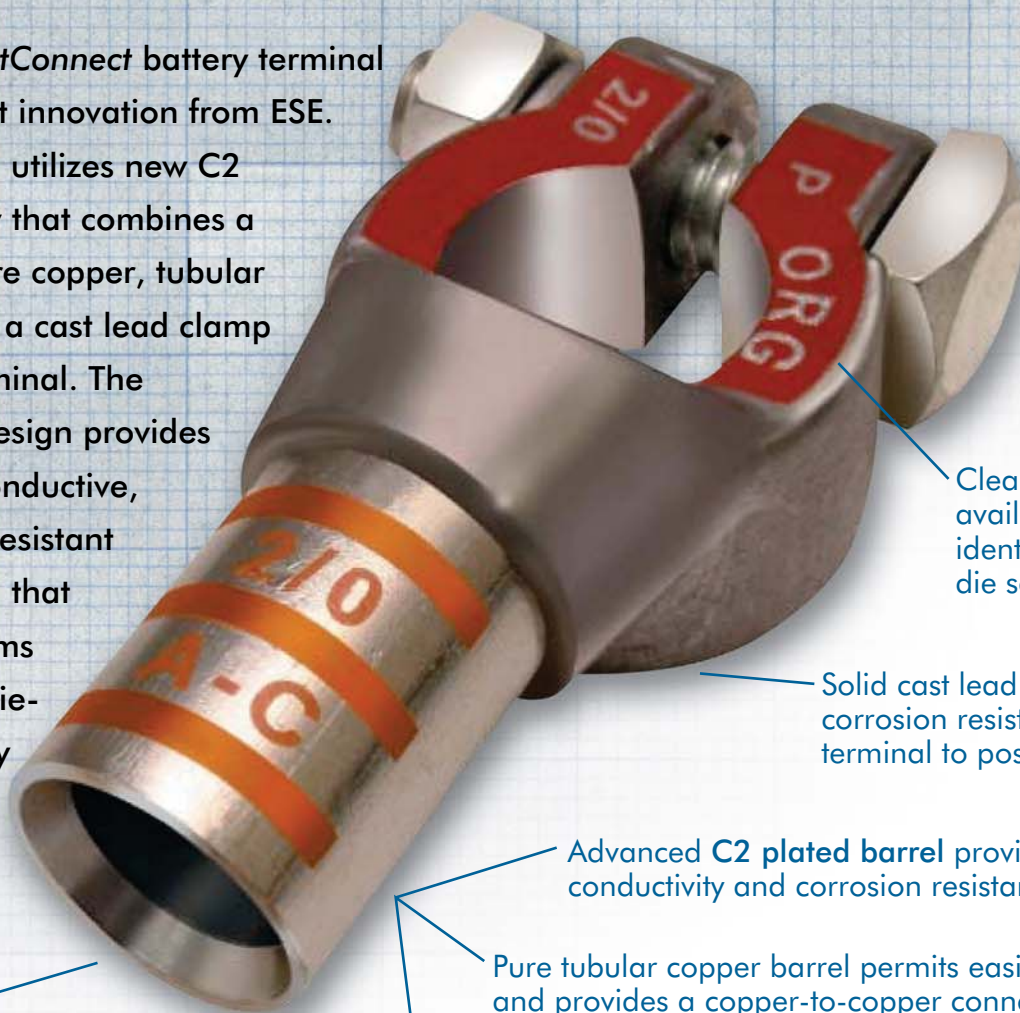

CORRECT Connect™

Bi-Metal Battery Terminals

The CorrectConnect battery terminal is the latest innovation from ESE.

The design utilizes new C2 technology that combines a plated, pure copper, tubular barrel and a cast lead clamp in one terminal. The bi-metal design provides a highly conductive, corrosion resistant connection that out-performs standard die-cast battery terminals.

Clearest color-coding available for correct identification and die setting.

Solid cast lead clamp provides a corrosion resistant lead-to-lead terminal to post connection.

Advanced C2 plated barrel provides superior conductivity and corrosion resistance.

Pure tubular copper barrel permits easier crimping and provides a copper-to-copper connection with the cable.

Longer barrel enables for double crimping ensuring a correct connection every time.

Deep chamfered barrel accepts the most flexible cable for trouble-free insertion.
